Description

Hi,

Since i use Project Hierarchy, I never need top project SCM Repository.

Main Project (No SCM)

Sub Project 1 (SCM Repository)

Sub Project 2 (SCM Repository)

So using Reposman.rb should create Repository even if SCM Module is enabled on project

I don't understand your problem.

I've just tested this in redmine :

Create a main project with SCM module disable
Create a sub project 1 with SCM module enabled
Create a sub project 2 with SCM module disable

And reposman say :

```
% ./extra/svn/reposman.rb -s /var/git -r localhost:3000 -o www-data --test
running in test mode
    create repository /var/git/subproject1
```

So, if SCM module is enabled in a subproject reposman create a repository.

My bad ... You right, no problem here.

You can close that issue.

Thanks..
