Redmine - Feature #12215

Option to inherit Issue Category list from Parent project to Sub-projects

2012-10-25 16:19 - Douglas Simpson

Resolution:	Duplicate			

Description

I don't think this is currently possible. (if this is please explain how this is done).

Having a standard "issues category list" user selectable inherit option, for sub-projects would avoid a lot of re-keying and data errors & break-by reporting issues.

This would be useful where project issues / tasks are used for process (or lifecycle) tracking ...

eg.

Inquiry ... Quoted ... Ordered ... Staged ... Shipped

or

Speccing ... Coding ... Testing ... Deployed & Complete ...

or

RNA given ... Item rx'd ... Repair Assessment ... Quoted ...
PO Rx'd ... In repair ... Returned complete

The route most people seem to be taking for inheritance is copying a project, from the Administration -> Projects page. If you're frequently creating projects of certain types, it's helpful to build (or designate from existing) a template project to serve this purpose.

It looks like that it was fixed some time ago #1653 but now is broken again... When you change issue project the category is lost even when names match.
What's more, on version summary when you Show version details in road map and then in "Issues by" you select Category there appears the same categories multiple times:

- project1
    - category1 (id 1)
- sub project of project1
    - category1 (id 5)

In result you'll get category1 twice if you selected the same version for issues.
