Description

The most Users which use redmine, are programmers. They need the **code highlight syntax** very, very often.

- In order to write less, as a editor in wiki
- I want to be able to press a button or a dropdown field, which surrounds my selected text (like bold, italic, underlined, pre, h1, h2 and so on which already does.)

Maybe someone can suggest a plugin if that exists.
Or shows me the code where the editor happens, so I can implement and provide it as plugin.

Many, many, thanks
