Description	
<p>Just to be clear, this request is specifically for field visibility based on the issue status, not a user role.</p> <p>I've seen numerous requests opened along these lines, however all I can find are issues relating to custom field visibility based on user roles. Many of the comments include people asking about status-based visibility, but I can't find anything more concrete than comments.</p> <p>In #8050, the request began with a request for controlling field visibility either by role or by status. Once it was partially completed, the "field visibility" side of the request was moved to #12005, which simply requests "Ability to hide field. Related to #8050.", and goes on to talk about custom field visibility based on roles.</p> <p>What are the chances of getting an additional option in the Workflow "Field Permissions" tab, in order to hide a custom field based on the associated issue status?</p>

Just to note: *this* issue's relation to #12005 is only as far as the description given in the initial issue creation. As per the description in #8050, I'm only thinking of the issue status here, not the "current user's" role.

As a temporary workaround for this, I've been making use of the Required / Read-Only selection in the Workflow > Field Permissions table. Turns out when the field is not populated, making it "Read-Only" actually hides the field.

I should note here that once any value has been set (in a different status for example) it's always at least visible, it simply can't be updated. So this definitely isn't a permanent solution..
