Description
When I get a list of issues I would like to know whether the issue is open or closed depending on the status. For example, an external application does not need to know specific statuses but just the open/closed information. According to a feature to filter issues by "open" or "closed" status I don't think it is difficult to involve this information to the issue element.

You can already get this information with Rest_IssueStatuses, I don't see the point of returning it with /issues, REST result is not supposed to be directly manipulated by humans?

I know I can get that information from Issue statuses, but I is necessary to make another request which is not effective. FYI I have an external system which retrieves all issues from Redmine (both open and closed) and I need to tell users their status.
