Redmine - Defect #16196

Redmine Installation and deployment

2014-02-28 08:12 - Rupesh Helwade

Status:	Closed	**Start date:**	
Priority:	Normal	**Due date:**	
Assignee:		**% Done:**	0%
Category:	Documentation	**Estimated time:**	0.00 hour
Target version:			
Resolution:	Invalid	**Affected version:**	2.3.0

Description

This [Installation](#) page has no proper links for the authenticated /recommended pages for deploying redmine on webservers other than webrick.
Users find it hard to locate the proper resource. I am struggling to get the correct page to deploy my Redmine installation on Solaris to any of the webservers.

I was thinking of using Apache Tomcat for the purpose but am almost confused. I also tried to see how can I do that with Apache + Passenger but with more confusing documentation.

Moreover, are there any guidelines/ recommendations to help users select the web server that is suitable for them.

History

- Status changed from New to Closed

- Resolution set to Invalid

The search will return a lot of wiki pages for almost all systems under the sun.
A search engine of your choice will return even more.

On a sidenote: Please ask questions on the forums.

Thanks for the comment.

I had already done that, but seeing the confusion/ inconvenience I faced, I felt that, this still could be improved if we have one common place describing the details.

Anyway thanks and best regards,
Rupesh
