Description	
<p>Hello, As we click on "All issues" on projects page (New project View all issues Overall spent time Overall activity)</p> <p>URL seen is : http://myURL/redmine/issues</p> <p>I save a query with filters as (Issue is Open and Project = All my projects) with name as "Open Issues from all my projects"</p> <p>The URL is seen as http://myURL/redmine/issues?query_id= 1;</p> <p>I see an issue list from all my projects (Pr1, Pr2 etc)</p> <p>But as I open one of the issue from Pr1, the query turns specific to Pr1, clicking on the Custom query, shows open issues from Pr1 only.</p> <p>This happens because, ?query_id = "some_id" is appended to the URL.</p> <p>The URL is now http://myURL/redmine/pr1/issues?query_id= 1; and not the one I created as http://myURL/redmine/issues?query_id= 1;</p> <p>This goes against my thinking when I created the query, as I am not viewing Issues from All My Projects now. Is there any way to avoid the confusion ?</p> <p>I would suggest: create a separator : All Project Queries bellow : (Public) Custom Queries.</p>
