Description

Hi,

I would like to filter target versions in calendar, but it seems to not work at all.

I have defined a custom field "Type" for target versions, which includes values like "Activity" or "Release". After that I created a few versions with different types in my project (see attachment "Redmine_TestActivity.png", "Redmine_TestRelease.png").

Then I added a filter to display target versions of type "Release". (Redmine_Calendar.png)

But after pressing "Apply" you still can see target versions of other types. See attachment "Redmine_Calendar.png": on 25th and 26th of June there are two versions of type "Activity", which have to be hidden.

Thanks
