Description

In the "tickets view" redmine admins and users can store several custom queries. The queries are shown at the right sidebar as link. Having a configuration option that adds some more functionallity to these links would be great. In our case the number of results behind a stored query is very interesting in some cases. The link could look like:

```
Custom Query ABC (35)
Custom Query BCD (0)
Custom Query CDE (5)
```

ABC => 35 results, BCD => no result and so on...

I think this could be interesting for more redmine users - not only for us. Maybe you can add this functionallity to redmine as a configurable option?

Wouldn't that mean that with each page request n queries have to be additionally made? I could imagine that this is to expensive.

Or those count values have to be pre-calculated. I mean they could be created and updated when tickets get changed. Not when the page is requested. But I think this is also expensive. And maybe not so easy to implement.

My two cents...

Of course there are several ways to imlpement this.
First step: If it was configurable every admin could decide if the queries really are expensive for the redmine instance and the redmine server.
Second step: A caching mechanism could be implemented. (Updated every x hours or depending on ticket status changes...
