| Description | | | |
| The attached patch allows for issues to be fixed for multiple versions. Some notes concerning this patch: | | | |
| <ul style="list-style-type: none">There is a couple of new language string that need translatingThe change log implementation was modified to work in the same way as the roadmap (but with different functionality of course). This was simply to avoid doing extra joins from issues to versions across the additional join table. The controller and view of change log and roadmap have a lot of common code now that could be refactored.The migration will only revert if each issue is marked as fixed in only one version, else it will raise an exception.The version selector is a HTML select list with multiple selections turned on. There are usability studies indicating that these are difficult to use, and having a list of checkboxes maybe a better option. There are plugins for doing this sort of thing, but I didn't really want to include a plugin as part of the patch :) | | | |

Hi Jean-Philippe,

I am wondering if you are averse to the functionality provided by this patch?

The current inability to record this information is pretty much a show-stopper for my company. If we were to take up redMine (which is looking quite likely at this time) then I would have to maintain and apply this patch every time we upgrade.

Is there anything else I can do to help this functionality through? Does it conflict with other areas of redMine (gantt chart, reports, ...)?

That said, I suspect that trunk has changed a lot since this patch was first submitted, and I would have to update it to ensure that it merges without conflicts.

It would be great to get your response, whether it is affirmative or negative.

Thanks,

#3 - 2007-07-10 16:37 - Jean-Philippe Lang

Hi Nick,
I'll have a deeper look at your patch this week-end, so I can give you an answer. Maybe I'll add a setting to allow issues to be fixed in multiple version.

BTW, do you find the Changelog view usefull ? In the current code, past versions can also be viewed on the roadmap, so I'm thinking about removing this view... Any feedback appreciated :-)

Regards

#4 - 2007-07-10 18:56 - Nick Read

Thanks Jean-Philippe; that would be great. I suspect the patch will not merge anymore, so tell me if you want it rewritten for the current trunk. A setting to allow/disallow this feature is good.

As far as the Change Log goes, I completely agree. It is not very often that I require a view of what has been released, only what needs to be done. That makes sense given that I'm a developer, but our marketing people would be more likely to need a list of what has been completed!

A good compromise would be to remove the Change Log functionality, but provide a persistent URL for viewing the details of a single release in the Roadmap view, even if the release has been completed. This would allow users to create wiki pages, news items or forum posts regarding a new release of the product, and provide a link to the roadmap/changelog of just that release. eg,

<http://demo.redmine.org/projects/roadmap/3/specific-release-id>

Any progress on this?

#6 - 2011-07-23 11:21 - Terence Mill

In general multiselect switch feature should be possible for all fields, also custom fields of type list or enumeration.

- Subject changed from Patch for feature request #9196 - Issues fixed in multiple versions to Issues fixed in multiple versions

#9 - 2014-07-07 14:35 - Alice Etchegaray

Hi, I tried to adapt this patch for redmine 2.x but it doesn't correspond...
Is there a new version for this patch ?
