Description

Wiki pages could be "lost" when you edit a page, i.e. when you remove the [[page]] marker in the parent page. Since Redmine has a redundant referencing system ([[page]] marker and the parent link), it could be easy to visit the wiki and tag pages which have a parent link but not referenced in the parent page (any [[page]] marker).

We could also imagine to colourize these pages in the index or insert a warning in the wiki page.

MoinMoin wiki has a such function to check for lost pages.

This plugin implements this feature https://github.com/bluezio/redmine_wiki_backlinks/

It should be integrated in redmine.
