

Redmine - Defect #24

SVN Repository attributes aren't saved if modified after creation

2007-03-20 23:15 - Antonio Salazar

Description	
<p>If one changes the SVN repository path after one has created and set it already, the path is not updated. This seems to be because of this bit in projects_controller.rb:</p> <pre>if params[:repository_enabled] case params[:repository_enabled] when "0" @project.repository = nil when "1" @project.repository = Repository.new @project.repository.attributes = params[:repository] end end</pre> <p>This seems to be fixed in trunk, but the fix is:</p> <pre>if params[:repository_enabled] && params[:repository_enabled] == "1" @project.repository = Repository.new @project.repository.attributes = params[:repository] end</pre> <p>Which would generate a new Repository every time a modification was made. It seems like a better solution would be:</p> <pre>if params[:repository_enabled] case params[:repository_enabled] when "0" @project.repository = nil when "1" @project.repository = Repository.new @project.repository.update_attributes params[:repository] # use update_attributes end end</pre> <p>If the update were to fail, then the save of the project would also fail due to the validate_associated validation in the Project model. Otherwise, whether it was or was not a new Repository, it would update the attributes and save, and only generate a new Repository once, when there was no previous one to update.</p> <p>A similar solution would probably work for the wiki.</p>	

History

#1 - 2007-03-21 14:32 - Antonio Salazar

There's me not paying enough attention to the code late at night :-). Sorry!

#2 - 2007-03-21 14:30 - Jean-Philippe Lang

As you it's fixed in the repository.

This code is what there is in trunk, but for the ADD action (that means called when you CREATE a project, so a new repository has to be created):

```
if params[:repository_enabled] && params[:repository_enabled]== "1"  
  @project.repository = Repository.new  
  @project.repository.attributes = params[:repository]  
end
```

The last code you "propose" is exactly what there is in the trunk but in the EDIT method of the projects controller.
