Description

I think adding keystroke recognition to allow for "quick links" to be available for re-usable commands would be a great addition.

For instance: in the Admin, an set of options would appear to create certain "hot keys" that would be listed within the footer for reference. Each keystroke "hot key" created could relate to a reusable command (such as "Create new task", "Edit Existing Task", "Wiki", "Upload Document", (etc.). Of course, the commands would need to be coded prior to implementation and custom hot key assignment by the Admin.

Is there anything like this in the roadmap?

Thanks for all the work put into this app! It's incredibly useful for our company.
