

Redmine - Patch #257

Optional project repository creation when using reposman.rb

2008-01-28 16:33 - Thomas Kjosmoen

Status:	New	Start date:	
Priority:	Normal	Due date:	
Assignee:		% Done:	0%
Category:	SCM extra	Estimated time:	0.00 hour
Target version:			
<b>Description</b>  This is a patch set to give the administrator/manager the option exclude projects from being automatically created when using the reposman.rb script.  To apply the patch, run the following command from inside your redmine directory: patch -p0 < /path/to/redmine-autocreate-repository.patch  One of the implications is that you can allow a subproject to use a folder in the parent project's repository, instead of creating completely separate repositories every time.  Hopefully, this patch will be useful.			

History

<b>#1 - 2008-01-28 17:12 - Thomas Kjosmoen</b>  Shoot... There was a couple of errors in that patch. The following patch works advertised.
<b>#2 - 2008-02-04 03:36 - Thomas Kjosmoen</b>  I see that in the transfer from rubyforge.org to redmine.org, the order of the patches were messed up. The correct patch is the largest one, i.e.: <a href="http://www.redmine.org/attachments/download/132">http://www.redmine.org/attachments/download/132</a>
<b>#3 - 2011-01-18 06:53 - Toshi MARUYAMA</b>  - Category set to SCM
<b>#4 - 2011-03-24 06:27 - Toshi MARUYAMA</b>  - Category changed from SCM to SCM extra
