Description
Hi,   I would like to choose a particular theme for a project, overwriting the default theme defined in global configuration.   It would be a good idea if you want to use the same Redmine for all your different customers, changing some styles and colours.   Cheers.

I've related patch #233 to this seems it provides quite a simple but working patch which could be easily ported to the current trunk I guess...

I would love to see this implemented as part of the trunk or as a plugin. I manage project for multiple clients and each has their own brand. Rather than setting everyone up with their separate copy of Redmine (a logistical nightmare), it would be much easier to setup each client with their own branded project.

This would be helpful. Much better than manually modifying CSS, creating classes for each project.
