

Redmine - Feature #29631

Add support to include repository file content in Wiki

Description	
<p>There is a Markdown macro include. It allows to include one wiki page inside another:</p> <pre>!{{include(Foo)}}</pre> <p>I would like to have similar functionality, but allowing inclusion of repository file. It could be used like this:</p> <pre>!{{include(source:repo_identifier some/file)}}</pre> <p>This way crucial documentation (README.md, INSTALL.md and so on) can be available both in repository and easily accesible from Redmine Wiki without redundancy (and inconsistencies).</p> <p>If such feature could go into Redmine core, I'm eager to provide relevant patch.</p>

I am also very much interested in this functionality. It would avoid redundancy and add a great deal of flexibility when creating documentation.
