| **Resolution:** | | | **Affected version:** | 4.0.1 |

**Description**

In case where wiki link is followed by opening parenthesis, it seems like parsing goes wild. For instance this sequence:

```
One two [[three|The Three]] (four) five.
```

should produce this output:

>    One two *The Three* (four) five.

but it produces this:

>    One two *[three|The Three]* five.

It actually acts, as external link, where "four" is the URL, but:

- there is a space between last closing square bracket and opening parenthesis (I would understand this behavior when there would be no space),
- square brackets are doubled, but external link mode took precedence over wiki link.

Currently one needs to escape opening parenthesis with backslash to force parser to see such a sequence as wiki link, not external link. IMO this looks like a glitch.
