Description It would be good to also to include as part of the history every time there is a change in the description or subject. this way you can know if someone changed it and when. If there is already a way to know that please let me know. thanks a lot

History

#1 - 2007-04-26 12:47 - Jean-Philippe Lang

As far as i know, subject changes are logged.

See: <http://demo.redmine.org/issues/show/2> for example (look at the last change).

If you want to save description changes, just change:

```
(Issue.column_names - %w(id description)).each {|c|
```

to:

```
(Issue.column_names - %w(id)).each {|c|
```

in app/models/issue.rb (line 64 in rev473)

Note that values shown in the history will be truncated to 255 chars, since value and old_value columns of journal_details table are varchar255.

#2 - 2007-04-26 13:11 - Mar T

Thanks i will try that.

The reason i asked for the description. is so when someone makes an issue request or reports it, they cant just change it without noticing it.

Thanks for the reply.

+1!

The tracker looks really good but this feature is a must to me.

It's really good if this is so easy to hack but I suggest to also include it in Demo (it's not there yet - just tried it).
