Some times projects can have status according to their stage or their conditions. Redmine has this feature for issues , what about create status or workflows for projects.

Eg:

Project A (alpha tests)

Project B (canceled)

Project C (delivered)

Project D (initiating)

Creating a custom-field (List with project status) for project may help you.

Some times projects can have status according to their stage or their conditions. Redmine has this feature for issues , what about create status or workflows for projects.

Eg:

Project A (alpha tests)

Project B (canceled)

Project C (delivered)

Project D (initiating)

Creating a custom-field (List with project status) for project may help you.

Right now I'm doing that, I was thinking more in some kind of tipification of Projects

Something like

Type 1: Init -> Plan -> Build -> Deliver

Type 2: Init BackLog -> Iter -> Deliver -> Iter -> Deliv

I think Redmine need a "Phase" tab on the project setting view.

The Phase's level is the top level in project, it's higher than the Version's level. When you create a version you must select a Phase where the version is belong to.

The Phase's level is the top level in project, it's higher than the Version's level. When you create a version you must select a Phase where the version is belong to.

What about a target version custom field, with this is possible to achive the phase feature and add other field like start date or risk level or what the imagination or the organizational context demands

I think the Phase is a character of a project, not of a version. There is a limit for a Phase, but no limit for version.

I think a phase tab is necessary.

I agree with J.N. Tang (#5) on this - I see it the same way.
