**Description**

Hi,

I would like to know how to access the "Link values to URL" of any issue using the REST API.

For eg. the tickets in our system can be accessed like below:

[https://ticket.my\\_company.de/redmine/issues/ABC-659](https://ticket.my_company.de/redmine/issues/ABC-659)

So, instead of the legacy issue id, I would like to get the id "ABC-659" from the REST API when I get a list of Issue objects.

I could not find that under the custom fields.

Thanks in advance for any tips and ideas.
