Description

When having a custom field you can only build up the url with this custom field value.
I need to build up a URL with custom field A and custom field B.

It would be really great if you can set up a URL like this:
http://test.com/?id=%value%&id2=%cf_11%

```
# Returns an URL generated with the custom field URL pattern
# and variables substitution:
# %value% => the custom field value
# %id% => id of the customized object
# %project_id% => id of the project of the customized object if defined
# %project_identifier% => identifier of the project of the customized object if defined
# %m1%, %m2%... => capture groups matches of the custom field regexp if defined
def url_from_pattern(custom_field, value, customized)
```
