Description

Recently I was developing plugin which adds *Editable by* to project's custom fields (works similar to *Visible by*). I analyzed RM code and found out Project has *editable_custom_field_values* - decided to override it in my plugin. Then I was surprised that in this method is not used in form. So my question is why this method even exists in Project model?

In issue or timelog forms *editable_custom_field_values* is used. Could we unify this?

BTW Don't you think it would be an desirable core feature? I mean ability to set which roles can edit specific custom field?
