

Redmine - Defect #38992

How do I use helper_queries_column_value helper hook?

Description

In app/helpers/queries_helper.rb, there is:

```
def column_value(column, item, value)
  content = ...

  call_hook(:helper_queries_column_value,
    {:content => content, :column => column, :item => item, :value => value})

  content
end
```

In my xxx_helper_queries_column_value_hook.rb:

```
def helper_queries_column_value(context = { })
  if context[:column].name == :action
    context[:content] = "Ushiro"
  end
end
```

I can change the parameter context, but when I checked in app/helpers/queries_helper.rb, I found that the variable content is not updated. So what's the proper way of using this hook? My guess is that this piece of code:

```
call_hook(:helper_queries_column_value,
  {:content => content, :column => column, :item => item, :value => value})

content
```

should be revised to:

```
content = call_hook(:helper_queries_column_value,
  {:content => content, :column => column, :item => item, :value => value})

content
```
