Description			
Hi,			
Actually Lot of objects in redmine had an id or a name (visible by users) but no reliable field between several redmine environnements (several database, several uses)			
I work with several environnements with databases which are not synchronized (so ID are différents between them, and name can evolved et be different)			
I need to synchronize parts of Redmine between environnements (always in the same way environnement A -> environnement B)			
For me, it's not reliable to create my synchronization on an ID or a Name, i think we should have a technical name/identifier on the objects.			
So what do you think of adding an identifier at least on those elements :			
<ul style="list-style-type: none">- custom fields- trackers- workflows- projects (already exists)roles			
What do you think of this feature ?			
Regards
