

Redmine - Defect #39931

Issues with Email Notifications Setup

2023-12-23 19:42 - Vugar Maharramov

Status:	Closed	Start date:	
Priority:	Normal	Due date:	
Assignee:		% Done:	0%
Category:	Email notifications	Estimated time:	0.00 hour
Target version:		Affected version:	5.0.1
Resolution:	Invalid		
Description			
Hello,			
I've encountered an issue with setting up email notifications in Redmine. Despite configuring the configuration.yml file, the email function does not seem to activate. Below are the steps I've taken and the current status of my system.			
Steps Performed:			
Edited the config/configuration.yml file to set up the email delivery method using SMTP settings.			
Performed a restart of the Redmine application. I attempted to use the command touch tmp/restart.txt, which resulted in a "No such file or directory" error, indicating that I might have been in the wrong directory or the tmp directory was missing.			
Restarted the Apache service using sudo systemctl restart apache2 to ensure that any changes in the configuration are applied.			
Checked the status of the Apache server using sudo systemctl status apache2 and confirmed it is active and running without any errors.			
Attempted to restart the SSH service as a part of my troubleshooting process, which was successful.			
Current Status:			
Apache is active and running.			
SSH service has been restarted without issues.			
Email notifications in Redmine are still not functioning.			
System Information:			
Linux redmine 5.4.0-169-generic #187-Ubuntu SMP Thu Nov 23 14:52:28 UTC 2023 x86_64 x86_64 x86_64 GNU/Linux			
Environment:			
Redmine version	5.0.1.stable		
Ruby version	2.7.0-p0 (2019-12-25) [x86_64-linux-gnu]		
Rails version	6.1.6		
Operating system:	Ubuntu 20.04.6 LTS		
Static hostname:	redmine		
Icon name:	computer-vm		
Chassis:	vm		
Machine ID:	62a4f1a11542451a96214708ae37c181		
Boot ID:	2ca118a361774af8a38e312ef7d7ed3c		
Virtualization:	vmware		
Operating System:	Ubuntu 20.04.6 LTS		
Kernel:	Linux 5.4.0-169-generic		
Architecture:	x86-64		
Environment	production		
Database adapter:	Mysql2		
Mailer queue:	ActiveJob::QueueAdapters::AsyncAdapter		
Mailer delivery	smtp		
Redmine settings:			
Redmine theme	Default		
Git	2.25.1		
Redmine plugins:	no plugin installed		
I am seeking assistance to understand what might be causing the email function to remain inactive and what additional steps I can take to resolve this issue.			
Thank you for your support.

This problem is related to your STMP server configured in configuration.yml which seems to have an invalid or self sign certificate. You should accept that certificate, use another SMTP server or, not recommended, disable SSL check (openssl_verify_mode => 'none').

Anyway, the problem is not from Redmine, you can use Forum to request help.

I'm sorry, but the following problem appeared. Everything is specified correctly in the configuration.yml file, the correct login and password were created specifically for this in the Active Directory (checked). Shown in the UGFzc3dvcmQ6 bug is the Base 64 encrypted word "Password". The fact is that in configuration.yml this parameter is indicated correctly as below (for confidentiality, some data has been changed). There are no screens between the Redmine and Postfix (there are no restrictions here either) servers; they are on the same subnet.

1. specific configuration options for production environment
2. that overrides the default ones

```
production:
  email_delivery:
  delivery_method: :smtp
  smtp_settings:
  address: My IP
  port: 587
  domain: x.com
  authentication: :login
  user_name: redmine@x.com
  password: NAdsfgjhsdk
  enable_starttls_auto: true
```

I even wrote these parameters in the configuration.yml file to view the logs it showed that there were no problems

```
openssl_verify_mode: none
logger: true
```

Even on the mail server side, everything is fine in the logs.

Based on the Postfix and Amavis logs you provided, it appears that emails from redmine@x.com are actually being accepted and processed by your mail server.

DKIM Verification: There are records indicating that emails from redmine@x.com pass DKIM (DomainKeys Identified Mail) verification. This is a good sign, since DKIM is an important part of sender authentication.

Amavis Processing: Amavis, a content filtering system for mail servers, processes messages and marks them as "CLEAN". This means that the emails do not contain viruses and are not considered spam.

Transfer to Postfix: Emails are successfully transferred back to Postfix for further processing and delivery.

Letter delivery: There are records of letters being queued for delivery and being successfully delivered. For example, lines with queued as 4SzMqV30PRz8JwW7 and status=sent (delivered via dovecot service) indicate that the delivery process is successful.

But the error still appears.

Please share your knowledge. Maybe I'm doing something wrong?
