| Description | | | |
| <p>Hi, I'm having troubles when importing issues. I make an import of 5 tasks. Then, I assign those task to several subtasks in a CSV file as Parent Tasks, basically to import all subtasks in this second step. However, when importing, the field "Parent Task" doesn't appear in the list, so I can't make . Parent TaskField is active in the corresponding tracker. I test it in 2 different instances (4.2.2. and 5.1.2.), and they have the same problem. I can't find a configuration for this, is there someting that I'm missing? Many txs!</p> <p>(sorry, my instance is in spanish. The field name in spanish for "Parent Task" is "Tarea Padre", and is not there)</p> <p>clipboard-202403051849-2kdqp.png</p> | | | |
