Description

Idea

Working with Wiki, I often think, about how great would it be, if there will be any way to define some the words as **keywords** that will be automatically replaced with others (formatted) on all wiki pages (during view).

For example, I'd love to see that some words (User configurable) will be replaced with another (user configurable)

Example

For example:
every "Redmine" word in my wiki can be replaced with

```
"Redmine":http://www.redmine.org
```

every "Configuration" replaced with

```
[[Configuration]
```

every "Export" to be replaced with:

```
[[export|экспорт]
```

and so on.

Configuration

All that needed to configure:
1) specify text1 that should be replaced
2) specify text2, that will replace text1

Text replace should be done on rendering (no changes to source text).

Benefits

Such feature allows to avoid most of the routine job of formatting and keeping information up-to date.

I suppose it will not be hard to implement, but it allows to use Wiki in most productive way.

What do you think about that?

+1
with unicode support

#4 - 2011-05-06 09:58 - Ebrahim Mohammadi

Maybe this feature could be used to implement [#3671](#).

#5 - 2012-07-06 21:02 - Cassiano Monteiro

+1!

It would be very useful for getting terms from a Glossary.
