Description

Hello dear community,

I'm having trouble installing Redmine on my laptop. In the past, I've worked with Redmine at previous employers and found it to be a fantastic tool. I've recently changed jobs and believe that Redmine would be an excellent solution for some of the challenges in my new company.

I wanted to install it on my laptop to demonstrate it to my colleagues, create tickets, and showcase its capabilities with some examples. However, I'm struggling to complete the installation. MySQL is causing issues, the database versions seem incompatible, gems won't install properly, and so on.

Is there a detailed step-by-step guide for installing Redmine on Windows, especially for someone without extensive programming knowledge? Any help would be greatly appreciated!

Thank you in advance!
