**Description**

When many project arrive, also comes the coincidences among them.  
It means that I have created a Project type custom field so, I cant identify the kind of project, some times several custom fields doesnt apply to some kind of projects. For example some projects a support project need to identify , the first level and second leve Service desk Engineers but for a development project this is irrelevant.  
I propose something like the permission report but for the project fields accordin to an enumeration called project type. Or a list of types of projects where applies as is implemented for the issue custom fields  
Option 1 sample:

Project Name	Type 1	Type 2	Type 3
abc	yes	no	yes
bcd	no	no	yes
def	no	no	yes

+1

Need this feature very much! Also we need to assign issue custom fields to the project type it belongs to.

We have a lot of types of projects. Each type use special issues with special custom fields. And we can't use custom fields and all it features because they are system-wide.
