<b>Description</b>			
<p>Hello,</p> <p>As part of my job I'm using a ticketing system called Service-Now which has some nice features especially on the issue list.</p> <ul style="list-style-type: none"><li>- When right-clicking on a TH you can sort the list, make graphs.</li><li>- When right-clicking on a TD you can filter the list using this value (filter out or show matching)</li><li>- A gear on the table (where the green tick currently is) allows you to select which columns you want to display and in which order (with a modal interface).</li><li>- There is also a inline editing fonctionnality, which is in my mind a better solutions than the very long list of changes you can make using right-click, but that's matter of taste.</li></ul> <p>All this makes the issue list on Service-Now great and I think it would be a great benefit for Redmine as it would make it easier to deal with big issue lists.</p> <p>I would be happy to explain more in details if you need more infos. there is also a demo on the service-now website.</p>
