Redmine - Feature #540

Append suffix to cookie name

Description

If I run two Redmine instances on the same server (connecting to different databases and using two TCP ports),
the "_session_id" and "autologin" cookies don't work correctly because they are shared between the
two Redmine instances.

The idea:

If there was a configuration option (stored in the database) which defines a suffix that is appended to the cookie name,
different Redmine instances may have different cookie names. So the cookies won't get in each other's way.

History

#1 - 2008-01-09 09:38 - Thomas Löber

I found out that I can define the name of the session ID cookie by setting
ActionController::Base.session_options[:session_key] in config/environments/production.rb.

Unfortunately this has no effect on the "autologin" cookie.

- Status changed from New to Closed

A feature to configure autologin cookie name was implemented by #1763 (Redmine 1.2.0).
