Description

Hi,

Redmine does a great job concerning Ruby developpement with nice syntax coloring in the source viewer but as Redmine is also a very good way to manage projects in other languages such as PHP (and as far as I'm concerned, I work on PHP projects), this would be great to have syntax coloring and support for PHP files too (but I guess that it could interest many other languages)

Thanks

History

#1 - 2008-01-16 15:47 - Jean-Philippe Lang

php and tpl extensions added in [r1070](#). A simple php scanner for syntax coloring is also added.
