Redmine - Defect #5480

Missing features of subtask implementation (r3573)

2010-05-09 11:27 - Jens Goldhammer

Resolution:	Invalid	**Affected version:**	

Description

There are three features I miss in the current implementation of the subtask feature (r3573) in comparision to Erics patch in ticket #443.

- the issue hierachy in the issue view is missing. An overview of all substasks for one issue is very good in my eyes because you can edit them very easily and you get a good impression of all tickets belonging to the ticket! Maybe a kind of folding can be implemented to allow loading subtasks in a deeper hierachy via ajax.
- the autocompletion feature to add a new issue as a child of another issue. In the current trunk the user has to manually enter the id of the ticket.
- The current implementation does not allow to add a new issue as child to an existing ticket in the ticket view. You always have to navigate to the parent issue and than add a child issue. This increases the amount of clicks the user has to do.

Any reason why not integrating this into the current trunk?

Thanks,
Jens

See #5196. Please submit any improvement suggestions as a feature request.
Maybe we could display the issue tree by default when sorting by issue id.

> - the autocompletion feature to add a new issue as a child of another issue. In the current trunk the user has to manually enter the id of the ticket.

Somewhat related to the point below, but autocompletion is implemented:

> - The current implementation does not allow to add a new issue as child to an existing ticket in the ticket view. You always have to navigate to the parent issue and than add a child issue. This increases the amount of clicks the user has to do.

I did not want to add another field to the new issue form in order to keep it simple. For example, Jira works like this.
Please, fill a feature request if you really need this.
