Target version:			
Resolution:			

Description

Currently (1.0.1) the "Repository -> View differences" only shows differences in source code files. It should be able to show also have some kind of "Changed files" view so that changes in directory structure and added and deleted (possibly binary) files could be visualized.

TortoiseSVN's "Compare revisions" / "Changed files" views are a model example of this.

An extra feature for comparing binary files could be showing their md5 or sha1 hashes.

It would be very useful to output changed files between revisions in "View differences" with ability to click on them to go to their changes, this feature i miss the most from TRAC.

something like output of "git diff --name-status "
