Target version:			
Resolution:			

Description

As it is in version 1.0, *redmine:email:receive_imap* doesn't log information when something has gone wrong while handling incoming mail.

It would be a plus to reply to the mail's sender with diagnostic message.

Say the referenced project Id in the mail's body was wrong (tag project: pid). Then *redmine:email:receive_imap* would send a mail back saying that the referenced project ID was not found in the database.

The mail could be returned to sender or sender + a redmin administrator.

I agree. E-mails to my support address are not being pulled in to Redmine, and I'm left guessing as to exactly why.
