Description

In redmine it is possible to define custom query that can be saved in private or public way.

Sometimes it is required to evaluate issues (looking one by one and decide to whom assign or change the tracker) which are result of a custom query and this result list can be long.

It would be nice that each issue that belongs to a custom query has a sort of "next" link to the next issue in the result list; this could save 1 click when going back to the custom query and finding the next issue to evaluate.

I see the difficulties that if an issues belongs to more than 1 custom query, it could be complicated (which issue is next ?)

Do you think it is feasible ?
