Target version:		Affected version:	1.1.0
Resolution:			
Description Hello all I'm new with redmine and subversion! Well, I have a repository with several subdirectory (like everyone, I hope ;)) The structure is as follows: Repository Project name /branches /tags(with subdirectories) /trunk when I configure the path of my repository in redmine with svn://XXX/repository subdir/Project name/ or svn://XXX/repository subdir/ (or with file:///) all it's OK but if I use svn://XXX/repository subdir/Project name/trunk (or branches or tags or one of it's subdir) I get an error: "The entry or revision was not found in the repository." mine is in french but it's the same ;) with "Rendering common/error (500)" in production log file. The error is the same with a copy of the repository but with a new repository with the same structure all it's OK (I export the file from the first to the second one) and all seems to be good with my tortoise client. <ul style="list-style-type: none">• database version: MySQL 5.5• Ruby version: 1.8.7• Rails version: 2.3.5• Redmine version: 1.1.0• Subversion version 1.6• production.log error <pre>Processing RepositoriesController#diff (for X.X.X.X at 2011-01-13 19:45:54) [GET] Parameters: {"rev"=>"28", "rev_to"=>"9", "action"=>"diff", "id"=>"test", "path"=>["GM.c"], "controller"=>"repositories"} Rendering template within layouts/base Rendering common/error (500) Completed in 234ms (View: 47, DB: 16) 500 Internal Server Error [http://X/projects/test/repository/diff/GM.c?rev=28&rev_to=9]</pre> If someone has an idea? This repository is almost empty and I can recreate one, but if I can understand what is the problem I't would be very cool!
