**Description**

Maybe I'm missing something but when setting permissions I can't set different setting for the same role in another project: for example , I want that in project "A" a developer can set issues public or private but in project "B" he can't. Do I have to create a new role for this scenario?

It will be very helpful if it could be implemented.

Yes, roles are designed to handle different permissions on projects for the same user.

I guess you are confusing roles with groups.
